

Problem #2 Summary

SG1J

1. Date: 17 April, 1986
2. Time: 0707 hrs
3. Summary:
  - a. Site area seems to be open salt water.
  - b. At site, there is an oddly shaped column of water/steam/radiant heat which is rising up out of the surrounding water, and is circling, falling, moving in all directions. There are two distinct sounds: deep rumbling and splashing.
  - c. Moments before this event, the site was cold, windy, and there was a distant roar with a "popping" sound which was AOL'd as a plane in trouble.
4. Personal evaluation: Session began with strong AOLs and continued to have only data which fit them. Breaks were taken, and all AOLs were objectified, but same basic data kept coming back. If this session is "on target", the information is strong and clear, and very dependable. I have a suspicion, however, that there was a lot of AOL drive that I never managed to work through, and for this reason, would not readily put blind faith in the results.
